

DISCLAIMER

Ammonites does not guarantee successful identification. There are a lot of ammonite genera (over 3,000), way too many to all be documented by Ammonites.

Failed Identification

- If you failed to find your ammonite, its genus may not yet be documented.
- You might also have discovered a new genus.
- There might also be an error in the database.

Notes

- Some ammonites were sexually dimorphic, with a macroconch (female) and microconch (male).
- Some ammonite genera have species that look different, such as *Kosmoceras* (not all specimens have the lappets). In addition, the hooked protoconch of *Didymoceras* differs in size, shape, and direction in different species.
- Some genera like *Hungarites* and *Biferoceras* are not yet in the database.
